Santa Maria, CA 05/23/2016—Melfred Borzall now offers three different off-the-shelf barrel stabilizers, as well as the ability to customize the stabilizer, giving you a choice of solutions to your boring problems.

Reaming multiple times without supporting the drill rod can result in an oval shaped hole that makes pullback difficult and changes the depth of the product. Supporting and stabilizing the drill rod with a barrel packs the hole and prevents the reamer and product from sinking, allowing the product to install smoothly and stay on the correct path of the bore.

All Borzall Barrel Stabilizers, whether Deluxe, Value, or Plain, have two steel rings sealing the caps to keep water from filling the barrel, reducing the weight and adding strength to the barrel. Barrels are available as Plain with no end cutters or hardfacing around the barrel; Value with carbide cutters on the ends and hardfacing around the wear areas of the barrel; or Deluxe with cutters and blades on the ends, and hardfacing throughout the entire barrel body.

The Plain barrel is customizable to customer specifications for a specific job from the “A la Carte Menu”, including plugs/couplings; cutters; hardfacing; cap protectors; blades, and block cutters.

Let Melfred Borzall solve your problem of uneven, unstable, or dropped bores with our Barrel Stabilizer. We have the solution.
